Dear Hiring Manager,

I am a developer who works across the stack from low-level systems to user-facing products. Most of my recent focus has been into Huddle Surety, where I'm founding engineer and CTO. Leading a team of engineers, I've architected an AI-native platform that automates surety bond issuance in Go, TypeScript, and Python. I shipped the frontend using TypeScript and React, built 100+ REST API endpoints with Go and Postgres, and managed CI/CD pipelines in a Kubernetes cluster. Whichever part of the stack I was working on, I cared most about reliability and performance.

Outside work, I enjoy building close to the metal, such as building a terminal emulator or running a Kubernetes homelab on Raspberry Pis. I've also contributed to tools like Next.js, Kubernetes, and Echo as an avid user as I find gaps while working with them. Working in open source has helped me mature as an engineer with discipline and rigor, as users around the world rely on software I built.

What draws me to TENEX is building rigorous, high-performance software where reliability and correctness genuinely matter. I'm energized by hard technical problems, and I'd love to bring my instincts in systems and products to the engineering your teams tackle every day. I am excited by the prospect that the engineering impact I make would translate to more secure and smarter internet.

Sincerely,

Ethan (Taehoon) Lee
